

TERIA launches PYX, an all-in-one GNSS positioning solution providing centimetric precision geolocation in real time.

After 3 months of suspense around PYX, TERIA presented its new solution on 31 August 2021.

PYX, a versatile GNSS solution meeting the needs of all professions involving geolocation, combines for the first time hardware, service and software.

PYX is based on a multi-constellation receiver that associates the TERIA and TERIASat services to obtain centimetric accuracy even in dead zones. Using the latest generation GNSS chip, it offers ultra-fast convergence and optimum corrections wherever it is used.

With its on-board technology and Bluetooth 5.0, it can be connected to all controllers and tablets on the market and is delivered with business software for surveyors.

Its ergonomic design combines lightness, elegance and performance. The "One Touch" system makes it quick and easy to get started. Thanks to its intelligent GNSS module, it automatically switches between TERIA and TERIASat without user intervention.

Paul Chambon, CTO comments : *“This innovative solution is a world premiere. It is based on a latest generation GNSS receiver and a Quality of Service renowned with TERIA and TERIASat. The complementarity of these two services makes it possible to achieve an exceptional level of performance in geolocation.”*

Available at a single price of €6,990, the PYX pack includes a GNSS receiver, a field book, a multi-purpose handle, a one-year subscription to TERIA and TERIASat services, surveying software and a shock-resistant case.

About TERIA :

The TERIA Network was initiated in 2005 by the French Order of Surveyors with the ambition of providing the profession with a real-time geolocation tool of centimetric accuracy. The idea was to answer the obligation of georeferencing topographic production in a common reference frame. TERIA has successively developed its services to all geolocation players.
