

TERIA launches the TERIA Terminal, which allows to geolocate to centimetre accuracy, anywhere, anytime.

June 2020, TERIA, expert in real-time centimetric geolocation, announces the launch of the TERIA Terminal. With this new tool, your GNSS equipment becomes operational everywhere.

Thanks to the TERIA Terminal, turn your GNSS receivers into Satellite Receivers L-BAND and get centimeter accuracy in real-time even in white areas.

With its embedded technology and its compatibility with all GNSS equipment, the Terminal guarantees 100% optimal working conditions. It is an exceptional added value for any brand or manufacturer.

Ergonomically, the "One Touch" system enables the device to start up instantaneously thanks to its intelligent modem that automatically switches between phone or satellite communications without human intervention.

Paul Chambon, CTO comments : *"This innovative product is a world first as it combines two cutting-edge technologies: NRTK and PPP-RTK and this independently of each other. »*

About TERIA :

The TERIA Network was initiated in 2005 by the Ordre des Géomètres Experts with the ambition to provide the profession with a real-time geolocation tool with centimetric precision. The basic idea was to respond to the obligation to geo-reference topographic production in a single repository. TERIA has gradually extended its services to all geolocation players.
